Qwen2.5-7B-Instruct, temperature 0, strict response_format: json_object, 50 s timeout, RUNPOD_API_KEY/RUNPOD_ENDPOINT_ID from env (endpoint id defaults to the deployed one). Any failure → {ok:false, fallback:true} so onboarding never breaks.
- Extraction shape: skills (name+level 0–5), roles, yearsOfExperience, education, certifications, languages — exactly your spec. Skill names map onto the 40-skill taxonomy (token-overlap + a prompt-engineering alias); non-taxonomy skills like TypeScript/SQL/Kubernetes are dropped by design, LLM proposes, user confirms in the UI.
- Client (cv-step.tsx): scrub → POST de-identified text → LLM skills/years into profile; deterministic skillsFromCV fallback; busy state on the button; disclosure badge (AI-assisted vs deterministic) with new i18n keys in all four locales.
Verified end-to-end (warm endpoint, real output): ok: true, fallback: false — mapped {"python":4,"prompt-engineering":2,"machine-learning":4,"cloud":4,"data-analysis":3}, years 5, roles/education/certs/languages extracted. bun run lint clean. Docs updated (README env vars + privacy wording, architecture data flow, AGENTS.md).
Notes:
- Cold start (≈2 min) exceeds the route's 50 s runsync window → first call after idle falls back to deterministic; second call works. Warm it before demos (that's your "min 1 worker" lever — say the word and I'll set workers.min: 1, $1.10/hr standing).
- Call site 2 (narrative via the same endpoint) is next whenever you want it — /api/coach currently still uses GLM.
